<p><b>ENVIRONMENTAL SUSTAINABILITY IN THE PORT OF HUELVA</b></p>	
<p>The Port of Huelva is located in an estuary where protected areas with high ecological value coexist together with a powerful port and industrial sector.</p> <p>Therefore, conceiving the port management from the natural space where it is located and a proactive action for the conservation and improvement of the environmental quality of the estuary is key to the success of the activity of the Port of Huelva.</p> <p>In this context, projects such as the environmental recovery of the left bank of the Odiel river, and others related to the environmental management of dredging, to the control of environmental aspects and to the improvement the environmental performance of the Port Community, have achieved very satisfactorily a high level of integration of the Port with the environment and, therefore, the sustainability of the port activity.</p>
